Abstract

A mobile application designed to simplify the property-buying process by providing buyers with a convenient self-service platform. Users can browse available properties, view property details, check prices and locations, save their favorite listings, and contact sellers or agents. The app aims to reduce the need for manual assistance by giving buyers quick access to important property information in one place — helping users search, compare, and manage their preferred properties efficiently.

Core Features

User registration, property search filters, notifications, appointment scheduling, and inquiry management.

Goal

Make real estate buying faster, simpler, and more accessible through a mobile-based self-service solution.

Frameworks / Platforms / Software Used

Frontend & Backend

- **Frontend:** React.js
- **Backend:** Node.js with Express.js
- **API:** RESTful APIs using Node.js/Express
- **ORM:** Sequelize
- **Database:** MySQL (RDBMS)

Database Concepts

SQL, ER Modelling, Normalisation, Constraints, Joins, Transactions, Views and Stored Logic

Security & Communication

- **Authentication:** JWT (JSON Web Token)
- **Security:** JWT-based authentication and role-based access control
- **Communication:** Twilio for SMS/notification services

Development & Deployment

- **Testing:** Node.js testing tools
- **Dev Tools:** Visual Studio Code, Git and GitHub
- **Deployment/Containerisation:** Docker (if required)

Thank You
